[THE PROBLEM]

What issue does this app solve?

Atlanta has a thriving nerd community, but finding it isn't always easy...

[Events are scattered]

Information is spread across Discord, Reddit, Facebook, Instagram, and word of mouth

[Hard to stay in the know]

There's no centralized platform for discovering events

[Difficult to meet people]

Newcomers don't know where to start

[IDEAL USERS]

Who is this application for?

[Gamers]

Looking for tournaments

[Cosplayers]

Seeking meetups, photoshoots, and conventions

[Anime & Manga Fans]

Discovering cafes, screenings, and movie nights

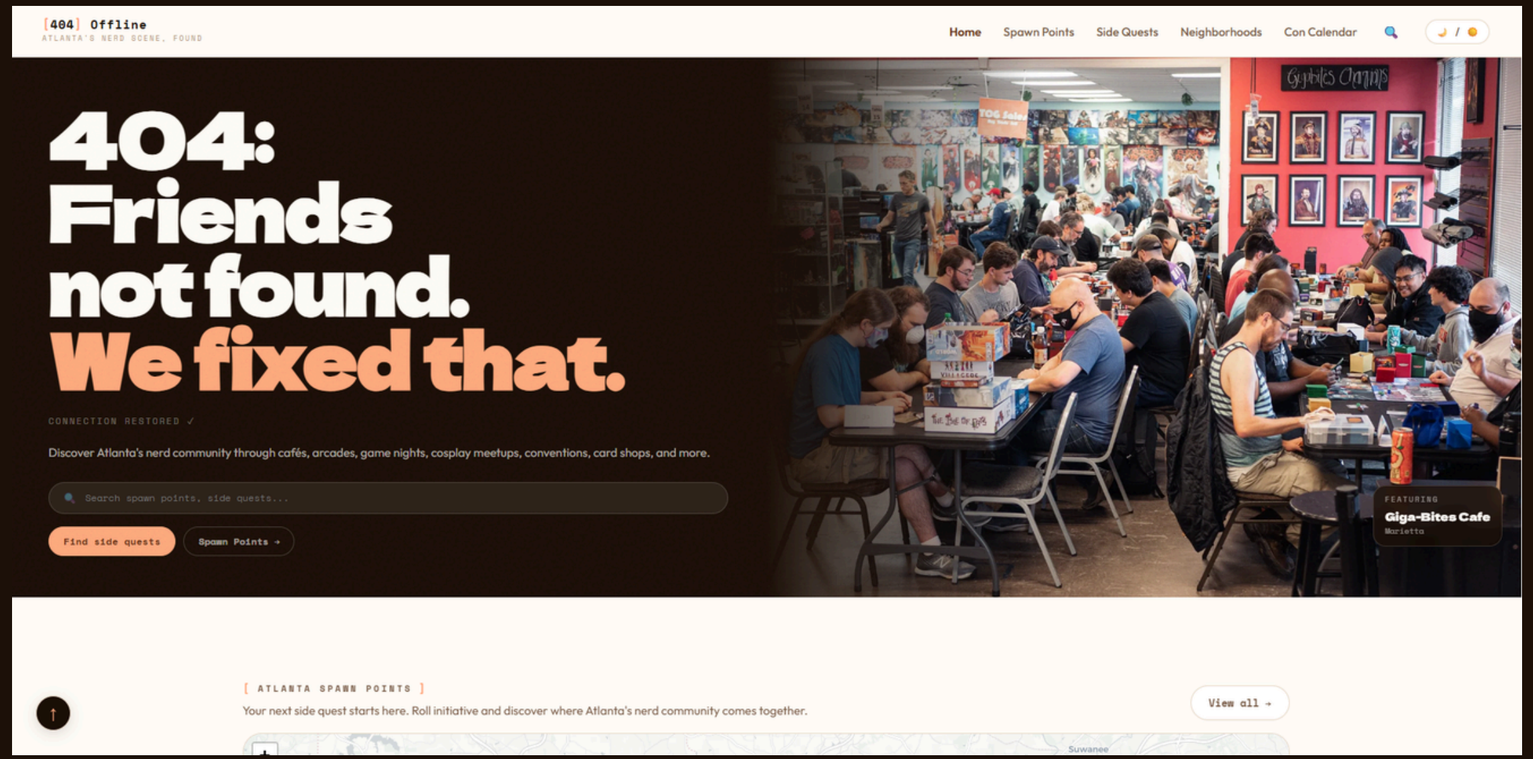

[Newcomers]

Finding friends and communities with shared interests

[Business Owners]

Looking to advertise their business and bring in more customers

[FRONTEND WALKTHROUGH]

What's the user experience like?

→

[CRUD OPERATIONS]

Managing events across the application

[CREATE]
Add a new event to the database.

[READ]
Browse and view existing events.

[UPDATE]
Edit event details such as date, location, etc.

[DELETE]
Remove outdated or canceled events.

Comments

Method	Route	Description
GET	`/api/comments/:sideQuestId`	Get all comments for a side quest
POST	`/api/comments`	Create a new comment or reply
PUT	`/api/comments/:id`	Edit a comment
DELETE	`/api/comments/:id`	Delete a comment

[SpawnPoint]

column	type	notes
id	int	primary key
name	string	venue name
category	string	gaming, comic, etc.

has many

[Suggestion]

column	type	notes
id	int	primary key
spawn_point_id	int	foreign key
author_name	string	submitter name

has many

[SideQuest]

column	type	notes
id	int	primary key
spawn_point_id	int	foreign key
name	string	event name

has many

[Comment]

[DATABASE TABLES]

How everything's organized behind the scenes

[Con]

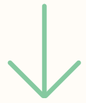

[SQL JOINS]

How is all of the data connected?

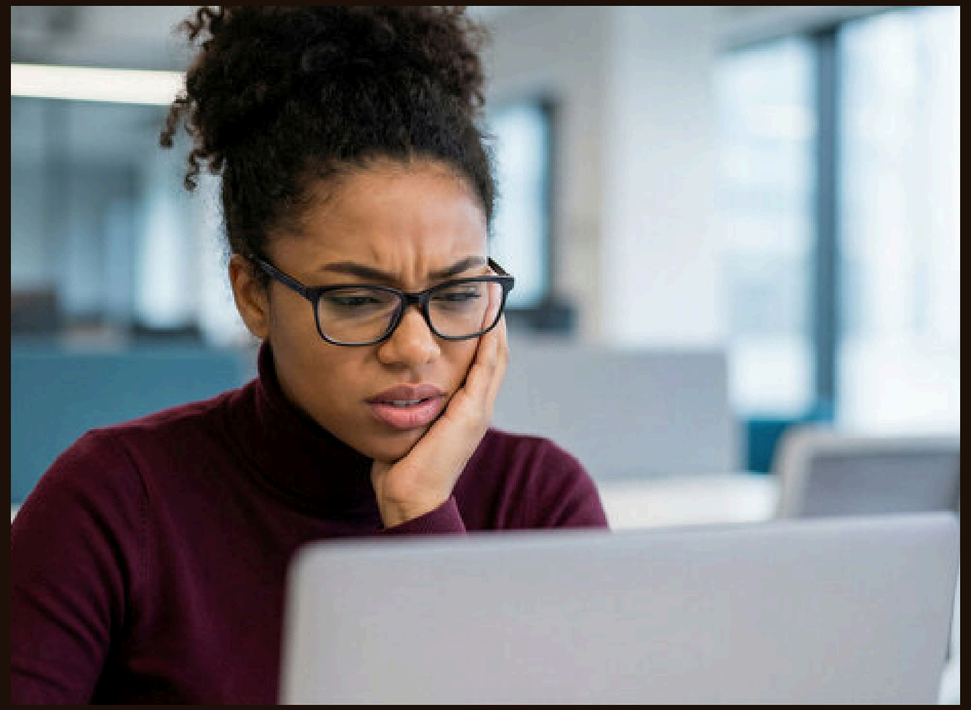

Used Prisma's relational querying system instead of SQL

Prisma's `include()` function can retrieve a large amount of information in just one query, when compared to multiple SQL JOINS

```
SELECT
  spawn_points.id,
  spawn_points.name,
  spawn_points.category,
  spawn_points.neighborhood,
  spawn_points.address,
  spawn_points.hours, spawn_points.description,
  spawn_points.image_url,
  spawn_points.is_marta_accessible,
  side_quests.id AS side_quest_id,
  side_quests.name AS side_quest_name,
  side_quests.description AS side_quest_description,
  side_quests.date,
  side_quests.time,
  side_quests.is_free,
  side_quests.cost,
  side_quests.category AS side_quest_category,
  side_quests.tags, side_quests.going_count, side_quests.is_featured,
  side_quests.image_url AS side_quest_image
FROM spawn_points
LEFT JOIN side_quests
  ON side_quests.spawn_point_id = spawn_points.id
WHERE spawn_points.id = $1;
```

```
const spawnPoint = await prisma.spawnPoint.findUnique({
 where: { id: parseInt(id) },
 include: { side_quests: true }
});
```

[TECHNICAL CHALLENGES]

What issues did I face?

[Designing a relational database]

Using foreign keys and one-to-many relationships to organize tables; avoiding data redundancy

[Leaflet.js]

The map container needs an explicit height, even if you have the coordinates, otherwise it will automatically be set to invisible /0 px

[Building a scalable app]

Organzing the backend using separate routs, controllers, and Prisma models for maintainability; how many things you have to touch

[Deployment]

Locally everything worked, but deploying with Prisma 7, database URLS moved from `schema.prisma` to `prisma.config.ts`

[AI IN DEVELOPMENT]

AI as a productivity and learning tool

[Brainstorming features]	[Explaining techincal concepts]	[Generating boilerplate code]	[Improving documentation]
Creating a more production-ready app	**Understanding more complex topics and design choices/debugging**	**Saving time by not writing code that has already been written a million times**	**Coming up with ideas for the presentation, README, comments, etc.**

My role

Selecting and refining the final product	**Applying those concepts to this project and testing/verifying they work**	**Modified and integrated the code into this app**	**Reviewing and editing the final content to make sure its cohesive and makes sense**

AI accelerated development, but all code was reviewed, tested, and adapted by me to fit the project's requirements.

AI is a tool, not a developer.

[AI REJECTIONS]

Evaluating AI responses. AI is not always right!

[Design Choices]

General design weirdness and suggested design ideas overall

[Future Features]

Keeping the app within scale of the current project requirements; not doing too much

[Prisma Deployment]

The fix ended up being simple, but some of AI's suggested fixes were rewiring the entire app

[FUTURE ENHANCEMENTS]

Features planned for future development...

[Version 1]

- Core CRUD
- Database
- Search

[Next Release]

- User Accounts
- Personalized Feed/Notifications
- Better quality photos
- Archive past events
- Better design
- Incorporate events from other sites/APIs

[Long-Term Vision]

- Community platform; clubs, guilds, meetups
- Mobile App
- Event Recommendations
- Interactive Map/Nearby discoverability

[THANK YOU!]
